

212/291

IN THE UNITED STATES PATENT & TRADEMARK OFFICE

In re Application of:

Mollenauer, et al.

Serial No.: 09/724,325

Filed: November 28, 2000

For: Resuscitation Device

Art Unit: 3764

Examiner: DeMille, Danton D.

ATTACHMENT OF CLAIMS AND AMENDED SPECIFICATION PARAGRAPHS

The claims, including those amended by the Response submitted herewith on March 12, 2003, are as follows:

1. (Unchanged) A chest compression device comprising:
 - a belt which is adapted to extend at least partially around the chest of a human;
 - a rotating member operatively connected to the belt to constrict the belt about the chest; and
 - a friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the human, said friction liner being adapted to extend substantially completely around the chest of the human, said friction liner permitting the belt to slide freely over said friction liner.
2. (Unchanged) The chest compression device of claim 1 wherein said friction liner is composed of a low-friction material.

212/291

3. (Unchanged) The chest compression device of claim 1 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.

4. (Unchanged) A chest compression device comprising:

a belt which is adapted to extend at least partially around the chest of a human;

a rotating member operatively connected to the belt to constrict the belt about the chest; and

a friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the human, said friction liner being adapted to extend substantially completely around the chest of the human, said friction liner is not attached to the belt such that the belt is free to slide over said friction liner.

5. (Unchanged) The chest compression device of claim 4 wherein said friction liner is composed of a low-friction material.

6. (Unchanged) The chest compression device of claim 4 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band a friction liner belt.

7. (Unchanged) A chest compression device comprising:

a belt which is adapted to extend at least partially around the chest of a human;

a rotating member operatively connected to the belt to constrict the belt about the chest; and

a friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the patient, said friction liner being adapted to

212/291

extend substantially completely around the chest of the human, said friction liner being separate from the belt.

8. (Unchanged) The chest compression device of claim 7 wherein said friction liner is composed of a low-friction material.
9. (Unchanged) The chest compression device of claim 7 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.
10. (Unchanged) A chest compression device comprising:
 - a first belt which is adapted to extend at least partially around the chest of a human;
 - a rotating member operatively connected to the first belt to constrict the belt about the chest; and
 - a friction liner in the form of a second belt, said friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the patient, said friction liner being adapted to extend substantially completely around the chest of the human, wherein said friction liner is not operatively connected to the rotating member.
11. (Unchanged) The chest compression device of claim 10 wherein said friction liner is composed of a low-friction material.
12. (Unchanged) The chest compression device of claim 10 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.
13. (Unchanged) A chest compression device comprising:
 - a belt which is adapted to extend at least partially around the chest of a human;

212/291

a rotating member operatively connected to the belt to constrict the belt about the chest; and

a friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the patient, said friction liner being adapted to extend substantially completely around the chest of the human;

wherein said friction liner provides a substantially stationary surface for the compression belt to slide over as the belt is constricted about the chest by the rotating member.

14. (Unchanged) The chest compression device of claim 13 wherein said friction liner is composed of a low-friction material.

15. (Unchanged) The chest compression device of claim 13 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.

16. (New) A chest compression device comprising:

a belt which is adapted to extend at least partially around the chest of a human;

a rotating member operatively connected to the belt to constrict the belt about the chest; and

a friction liner provided in addition to any clothing worn by the human, said friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the human, said friction liner being adapted to extend substantially completely around the chest of the human, said friction liner permitting the belt to slide freely over said friction liner.

212/291

17. (New) The chest compression device of claim 16 wherein said friction liner is composed of a low-friction material.

18. (New) The chest compression device of claim 16 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.

19. (New) A chest compression device comprising:

a belt which is adapted to extend at least partially around the chest of a human;

a rotating member operatively connected to the belt to constrict the belt about the chest; and

a friction liner provided in addition to any clothing worn by the human, said friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the human, said friction liner being adapted to extend substantially completely around the chest of the human, said friction liner is not attached to the belt such that the belt is free to slide over said friction liner.

20. (New) The chest compression device of claim 19 wherein said friction liner is composed of a low-friction material.

21. (New) The chest compression device of claim 19 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band a friction liner belt.

22. (New) A chest compression device comprising:

a belt which is adapted to extend at least partially around the chest of a human;

212/291

a rotating member operatively connected to the belt to constrict the belt about the chest; and

a friction liner provided in addition to any clothing worn by the human, said friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the patient, said friction liner being adapted to extend substantially completely around the chest of the human, said friction liner being separate from the belt.

23. (New) The chest compression device of claim 22 wherein said friction liner is composed of a low-friction material.

24. (New) The chest compression device of claim 22 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.

25. (New) A chest compression device comprising:

a first belt which is adapted to extend at least partially around the chest of a human;

a rotating member operatively connected to the first belt to constrict the belt about the chest; and

a friction liner provided in addition to any clothing worn by the human, said friction liner in the form of a second belt, said friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the patient, said friction liner being adapted to extend substantially completely around the chest of the human, wherein said friction liner is not operatively connected to the rotating member.

26. (New) The chest compression device of claim 25 wherein said friction liner is composed of a low-friction material.

212/291

27. (New) The chest compression device of claim 25 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.

28. (New) A chest compression device comprising:

- a belt which is adapted to extend at least partially around the chest of a human;

- a rotating member operatively connected to the belt to constrict the belt about the chest; and

- a friction liner provided in addition to any clothing worn by the human, said friction liner adapted to be disposed between the belt and the chest of the human when the belt is extended around the chest of the patient, said friction liner being adapted to extend substantially completely around the chest of the human;

wherein said friction liner provides a substantially stationary surface for the compression belt to slide over as the belt is constricted about the chest by the rotating member.

29. (New) The chest compression device of claim 28 wherein said friction liner is composed of a low-friction material.

30. (New) The chest compression device of claim 28 wherein said friction liner is selected from the group comprised of a belt, a vest, a corset, a girdle, a strap and a band.
